

Identity Option 1 - Implement ODIS (OMA-DM IMEI Sync)

The primary and preferred method to comply with AT&T's Identity requirement is to use a module that supports ODIS. This alternative requires minimum configuration on your host device and is much simpler to support throughout the life cycle of your device. You will need assistance from your chosen module manufacturer to determine if your module even supports an OMA-DM or LWM2M ODIS client. If your module supports ODIS then your module manufacturer will give you further integration instructions.

Once ODIS is integrated then your device will report the following identity information to AT&T:

1. Host Device Manufacturer
2. Host Device Model
3. Host Device Software Version
4. Host Device Unique ID
